Prepared by: Todd Downham, State of Oklahoma DEQ

Site: Lorraine Refinery, Creek County

EPA ID #: OKN000606909

1. INTRODUCTION

The State of Oklahoma Department of Environmental Quality (DEQ) under the Multi-Site Cooperative Agreement (CA# V-00645-01) with the U.S. Environmental Protection Agency (EPA), as authorized by CERCLA and as amended by SARA, conducted a Expanded site inspection (ESI) of the Lorraine Refinery Site (CERCLIS # OKN000606909), located in Creek County, Oklahoma (Reference 1).

The purpose of this investigation was to collect information concerning conditions at the site sufficient to assess the threat posed to human health and the environment, to determine the need for additional investigation under CERCLA/SARA, and, if appropriate, support site evaluation using the Hazard Ranking System (HRS) for proposal to the National Priorities List (NPL). This investigation included reviewing information collected during the site visits, sampling environmental media for determination of the presence and extent of hazardous substances on-site and the migration of these substances from the site, evaluating and documenting HRS factors, and collecting additional non-sampling information. The ESI followed the procedures set forth in the *EPA Guidance for Performing Site Inspections Under CERCLA*, Interim Final, EPA 540-R-92-021 and will be used in support of a decision by EPA Region 6 as to whether the site warrants further investigation under CERCLA (Reference 2).

The project followed the procedures set forth in the Quality Assurance Project Plan (QAPP) (Reference 3) and the approved DEQ Quality Management Plan (QMP) for State fiscal year 2009-10, EPA QTRAK # 09-039 (Reference 4).

2. SITE DESCRIPTION

2.1 Location

The Site consists of the former Lorraine/Wilcox Refinery located in N ½ of the NW 1/4 of S29 T16N R9E and the SW 1/4 of the SW ¼ of S20 T16N R9E in Creek County, Oklahoma. The site's center has the coordinates 96°22'48.693" West longitude 35°50'26.8966" north latitude. The site covers approximately 125 acres (Reference 5; Figure 1).

2.2 Site Description

The site includes remnants of former oil refining operations and tank farms. The site can be divided into four major former operational areas: two refining areas and two tank farms. An active railroad divides the two former refining areas and former tank farms. Most of the refinery structures and tanks have been removed or are in ruins. The northwestern portion of the site, west of the railroad and north of West 221st Street South/Refinery Road, was used as a tank farm, but is now rural land no longer used for refinery purposes. The southwestern portion of the site had refining operations and several large storage tanks. The southwestern portion is the location of the First Assembly of God Church and one residence (Reference 5).

East of the railroad and south of West 221st Street South/Refinery Road were refining operations and a tank farm to the east. There are a total of six residences on the site, several of which are located on former tank or refinery operations locations. Three of the residences located on the eastern portion of the site are known to use water from domestic/private wells.

The drainage pattern of the site is primarily towards Sand Creek that follows the western and southwestern boundaries of the site. Two streams cross the portion of the site east of the railroad, both of which flow into Sand Creek (Reference 5).

There are multiple areas of stressed vegetation, barren areas, and visible black tarry waste of a hydrocarbon nature (Reference 5).

A detailed title search in the Creek County Clerk office confirms that the property was used in oil refinery operations from 1915 until November 1963. Site access is not controlled. There are no fences on the property and there are no schools or day cares located within 200 feet of the site (Reference 5).

2.3 Previous Investigations and Regulatory History

A Preliminary Assessment (PA) was performed at the former Wilcox Refinery by the Oklahoma Department of Environmental Quality (ODEQ) in December 1994 (Reference 6).

An ESI was performed at the Wilcox site for the Environmental Protection Agency (EPA) in March 1997 (Reference 7).

A Site Assessment (SA) was performed at the Wilcox Site by EPA in March 1999 (Reference 8).

A PA was performed at the former Lorraine Refinery by ODEQ in September 2008 (Reference 9).

A SI was performed at the Lorraine Site by ODEQ in August 2009 (Reference 10).

There is no information of any regulatory measures taking place at either refinery.

2.4 Operational History and Waste Characteristics

The area was once occupied by an oil refinery. The wastes associated with this type of facility include crude oil, tank residues, brine, acid and caustic sludges, heavy metals, petroleum products, coke, sulfur compounds, and solvents. Waste management practices are unknown for this facility (Reference 5).

There is no information of any regulatory measures taking place at the refinery. The Sanborn Insurance Map indicates that the property contained about 65 storage tanks of various sizes, a cooling pond, and around 10 buildings housing refinery operations. The map also indicated that crude oil, fuel oil, gas oil, distillate, kerosene, benzene, and benzene (petroleum ether) were all stored on the property by the Lorraine/Wilcox Refining Company (Reference 5). There are several areas of stressed vegetation, barren soil, and spots of tarry waste (Reference 5).

3. WASTE/SOURCE SAMPLING

After reviewing a Soil Survey of Creek County (Reference 11), Sanborn maps (Reference 12), and previous investigations (References 5, 6, 7, and 8), samples locations were determined.

3.1 Sample Locations

Table 1, Figures 3 and 4 presents sample numbers, locations, and objectives for all samples collected during the ESI. Nine soil samples, five waste samples, ten ground water samples, two background samples, and three QA/QC samples were collected to identify hazardous substances at the site and investigate whether these substances have been released into the environment, especially a possible migration of the contaminants from the site to the aquifer (Reference 18).

3.2 Analytical Results

The collected samples were analyzed for total metals; including mercury, Volatile and Semi-volatile Organics using Oklahoma State Environmental Laboratory (SEL) methods and procedures (Reference 13 and 14).

The following Waste samples showed elevated levels of Semi-volatile Organic contaminants: Waste samples LWW-4 and LWW-5 (Reference 14).

The following Waste samples showed elevated levels of Metals contaminants: Waste samples LWW-1, LWW-3, LWW-4, LWW-5, and LWW-6 (Reference 14).

The following Surface Soil samples showed elevated levels of Metals contaminants when compared to background samples: Surface Soil samples LWSS-3, LWSS-4, LWSS-5, LWSS-6, LWSS-7, and LWSS-8 (Reference 14).

The following Groundwater samples showed elevated levels of Metals contaminants when compared to background samples: Groundwater samples: LWGW-1, LWGW-2, LWGW-3, LWGW-4, LWGW-5, LWGW-6, LWGW-7, LWGW-8, and LWGW-10 (Reference 14).

The analytical data for these samples is shown in Tables 2, 3, 4, and 5 of this document.

3.3 Sources

Based on the analytical data presented in Tables 2, 3, 4, 5, and information collected during the sampling event, the location, type, and size of on-site source was determined.

After triangulating between Surface Soil sample points LWSS-3, LWSS-4, LWSS-5, LWSS-6, LWSS-7, and LWSS-8, it was concluded that the contaminated soil source area is a polygon and covers about 12.5 acres (Figure 5).

The area of contaminated soil is considered a waste source for the purposes of this ESI.

Previous investigations and historical documents/maps provide information about location and size of former storage tanks used by the refinery. The total area covered by former tank locations, where waste samples were collected, and which indicate measurable levels of contaminants is considered a waste source for the purposes of this ESI (Reference 2, Figure 7).

3.4 Conclusions

The site area contains elevated concentrations of metals in all but one Surface Soil sample location. Elevated organic compounds are present in two former storage tank locations in the middle and southwest portions of the site. The presence of elevated levels of contaminants could be explained by the former refinery activities on the site. The waste is unconfined and could migrate off site via ground water pathway, surface water runoff, or in the air. The presence of elevated metals and organics suggests a potential release of contaminants to off-site surface waters (Reference 14; Figures 5 and 7).

4. GROUND WATER PATHWAY

4.1 Hydrogeology

The Barnsdall Formation is approximately 200 feet thick at the site and consists of massive to thin beds of coarse to fine grain sandstone, irregularly interbedded with sandy to silty shale. Sandstone outcrops of the Barnsdall Formation are common throughout the site, and potentially receive ground water recharge from downward infiltration of direct precipitation at the surface, as well as infiltration from shallow, perched ground water zones. The Barnsdall Formation is a bedrock aquifer but is not considered to be a Principal Ground Water Resource by the Oklahoma State Department of Health (OSDH). However, the site is in close proximity to the Vamoosa-Ada aquifer (References 6 and 8).

The upper part the Barnsdall Formation and Sand Creek alluvial aquifer are unconfined, with shallow water table. The site is in a potential recharge area and thus is susceptible to ground water contamination from petroleum waste or contaminated soils. Depths to seasonal perched water zones are less than 10 feet and the shallowest regional water bearing formation is reportedly less than 25 feet below ground surface (bgs) (References 6 and 8).

4.2 Targets

Of the residences on site, three have private wells that are used for drinking water. There are three residents directly north of the site and two residents south of the site that use ground water from private wells. A total of eight residents on/near the site are considered to be primary targets for the Ground Water pathway of this investigation. There are four residences on site that obtain water from public/municipal wells that are located within 2 miles of the site; these wells are outside the influence of the site (References 5 and 15; Figure 3).

The total population served by private wells is described in the table below. The numbers were arrived at by multiplying the number of wells by the estimated average number of persons (2.53) within each household in Creek County, with the exception of the On-site populations which were determined by direct communication with residents (References 5 and 10).

Private/Domestic Wells

Distance from Site (mi)	# of Wells	Est. Population Served by Private Wells
On-site	3	9
0 – ¼	8	24
¼ - ½	0	0
½ - 1	4	10.12
1 – 2	25	63.25
2 – 3	20	50.6
3 – 4	29	73.37
Total	89	230.34

There are five ground water wells, that compromise the City of Bristow public water supply system, located about 1-2 miles west, northwest, and southwest of the site, in the direction opposite and perpendicular to ground water flow. There are no public water wells contributing more than 40% of the total output of the system, which serves an overwhelming majority of the population of the area of interest. The population was calculated by multiplication of the number of households connected to the public water system by the average number of persons per household (References 10 and 15).

It was decided that sampling of the public/municipal ground water wells is not warranted for the purposes of this ESI.

Public Wells

Distance from Site (mi)	# of Wells	Est. Population Served by Public Wells
On-site	0	0
0 – ¼	0	0
¼ - ½	0	0
½ - 1	0	0
1 - 2	5	3869
2 – 3	0	0
3 – 4	0	0
Total	5	3869

4.3 Analytical Results

Ground Water samples from private residential wells were collected during the ESI and were analyzed for total metals and the volatile and semi-volatile organics (References 2, 3 and 5). Concentrations greater than three times background for several metals were detected in all Ground Water samples collected during the ESI, however metals concentrations were not considered to be a health threat when compared to MCL's (References 2, 14 and 16; Figure 6).

The analytical data for the soil samples are presented in Tables 2.

4.4 Conclusions

Primary private target wells were identified and sampled within the study area. Public/municipal wells were determined to be outside the influence of the site and were not sampled for the purposes of the ESI. Sample results indicate elevated level of contaminants, but were below concentrations that would pose a threat to human health.

5. SURFACE WATER PATHWAY

5.1 Hydrology

The drainage pattern for the site is generally to the south. There are three locations where overland flow of surface waters across the site enters perennial waters (Sand Creek). These three locations are likely the most significant probable point of entry (PPE). Sand Creek meanders approximately 2 miles east until it merges with Little Deep Fork Creek, which is the third surface water body within fifteen miles downstream of the PPE (Reference 2; Figure 2).

According to gauging station #07243500 located in the NW ¼ of the SW ¼ of S20 T14N R12E in Okmulgee County, approximately 25 miles southeast from the site, the annual flow rate of the Deep Fork River is 806 cfs. The average annual precipitation in the area is about 37 inches. The 2-year, 24-hour rainfall is about 3.8 inches. The site is not located within the 100-year flood plain (Reference 10).

5.2 Targets

According to the State of Oklahoma, Sand Creek is considered a Habitat Limited Aquatic Community, and a Secondary Body Contact Beneficial Use, as well as having agricultural and aesthetic beneficial uses. Little Deep Fork Creek downstream from Sand Creek is considered a Warm Water Aquatic Community, and a Primary Body Contact Beneficial Use, as well as having agricultural and aesthetic beneficial uses. The Oklahoma Department of Wildlife Conservation lists the Heyburn Wildlife Management Area within the 15-mile target distance. This area and its associated watershed are considered to be sensitive areas (Reference 10).

Several species have been identified within the study area as endangered: American Burying Beetle (*Nicrophorus americanus*), and Interior Least Tern (*Sterna antillarum*). Species identified as threatened or vulnerable are: Woodchuck (*Marmota monax*), Prairie Mole Cricket (*Gryllotalpa major*), and Bachman's Sparrow (*Aimophila aestivalis*). There is no drinking water intakes associated with the surface water pathway (Reference 10).

5.3 Sample Locations

No Surface Water or Sediment samples were collected for this phase of the investigation.

5.4 Analytical Results

No Surface Water or Sediment samples were collected for this phase of the investigation.

5.5 Conclusions

Former investigations indicate measurable levels of contamination that is likely related to refinery operations. Samples collected from Sand Creek and its tributaries may be warranted in a future investigation.

6. SOIL EXPOSURE PATHWAY

6.1 Physical Conditions

The Site consists of the former Lorraine/Wilcox Refinery located in N ½ of the NW ¼ of S29 T16N R9E and the SW ¼ of the SW ¼ of S20 T16N R9E in Creek County, Oklahoma. The site's center has the coordinates 96°22'48.693" West longitude 35°50'26.8966" north latitude. The site covers approximately 125 acres (Reference 5).

6.2 Targets

There are seven residences and a church located on site. This phase of the investigation focused only on the three eastern-most residents located on the former Wilcox tank farm area.

6.3 Sample Locations

Eight Surface Soil Samples were collected from the site and one background collected outside the influence of the site. Samples were collected from residential yard areas and down gradient of each residence located within the site boundary.

Soil samples were taken in order to determine whether the soil is contaminated and if so, to what extent (References 2 and 5).

Soil samples locations are described in Table 1 and depicted in Figures 3 and 4.

6.4 Analytical Results

Surface soil samples collected during the ESI were analyzed for total metals and the volatile and semi-volatile organics (References 2, 3, 5 and 13).

Concentrations greater than three times background for several metals were detected in most soil samples collected during the ESI (Reference 14; Figure 5). The analytical data for the soil samples are presented in Table 3.

6.5 Conclusions

After triangulating between sample points LWSS-3, LWSS-4, LWSS-5, LWSS-6, LWSS-7, and LWSS-8, it was concluded that the contaminated soil source area has the shape of a polygon and covers about 12 acres. Acreage was plotted using Geographic Information System (GIS) mapping software (Reference 17, Figure 5).

7. AIR PATHWAY

7.1 Site Conditions

It is likely that air emissions occurred during the operational period of the Lorraine Refinery; however, the only emissions of concern currently at the site are contaminated soil particles and semi-volatile organics that could become airborne.

7.2 Targets

The residents living on site are considered the nearest individuals. The estimated population and wetland acreage within four miles of the site is described in the following table (References 5 and 9).

Estimated Population and Wetland Acreage

Distance from site (mi)	Estimated Population	Estimated Wetland Acreage
On-site	19	2
0 - ¼	54	4.5
¼ - ½	495	7
½ - 1	1,836	9
1 – 2	2,691	65
2 – 3	1,017	145
3 – 4	517	112
TOTALS	6134	342.3

7.3 Sample Locations/Analytical Results

Since air sampling is outside the scope of an ESI, no formal air monitoring program was conducted and no air samples were collected.

7.4 Conclusions

A release to the air pathway has not been documented at the site, and no odor was detected during the sampling event.

8. SUMMARY AND CONCLUSIONS

Two refinery process facilities and storage tank areas once operated on the site. The site area contains elevated concentrations of metals and several organic compounds, which can be explained by the former activities at the former Lorraine and Wilcox refineries. It is estimated that approximately 12 acres, is covered by contaminated soil, based on samples collected. A large volume of visible waste is present where storage tanks once stood. The waste is unconfined and could migrate off site via the ground water pathway, surface water runoff, or in the air. Elevated levels of metals in surface soil samples collected may be considered as an indicator of the migration of the contaminants from the site down gradient towards Sand Creek. A final

conclusion as to the extent of contamination and migration of contaminants into Sand Creek and beyond requires an additional investigation.

Memorandum

December 15, 2009

To: Karen Khalafian, Oklahoma Department of Environmental Quality

From: Gayle Bartholomew *GB*

Re: Quality Management Plan (QMP) – QTRAK #10-026

The attached letter from U.S. EPA approves DEQ's Quality Management Plan effective December 2, 2009. Also attached is a copy of the fully executed signature page. The plan will remain in effect for one year from the date of Mr. Johnson's signature. Updates or a revised plan will be submitted to EPA in October 2010. If you have any questions or need additional information, please do not hesitate to contact me by phone at (405) 530-8996 or email gbartholomew@environment.ok.gov.

Enc.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 6
1445 ROSS AVENUE, SUITE 1200
DALLAS, TX 75202-2733

December 2, 2009

Ms. Gayle Bartholomew
Environmental Grants Administrator
Office of the Secretary of Environment
3800 North Classen Boulevard
Oklahoma City, OK 73118

Dear Ms. Bartholomew:

The Region 6 Quality Assurance Staff has reviewed the updated Quality Management Plan (QMP) for the Oklahoma Department of Environmental Quality (ODEQ), which was assigned the QTRAK number 10-026. Since the QMP has only had minor changes since it was last approved, the QA Staff has recommended that the revised document be approved as submitted.

I have enclosed six originals of the QMP signature page, with my approval signature, for your and ODEQ's records. We appreciate your and ODEQ's efforts in keeping this document current. If you or ODEQ have any questions or concerns, Dr. Romig, who reviewed your QMP, may be reached at (214) 665-8346, or I may be reached at (214) 665-8343.

Sincerely yours,

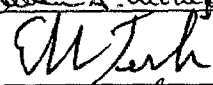

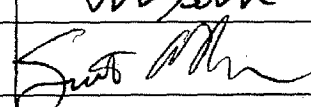

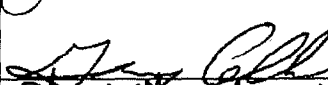

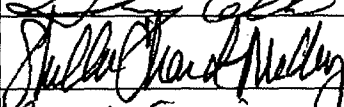

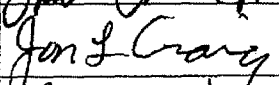

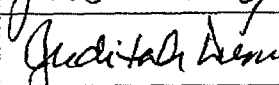

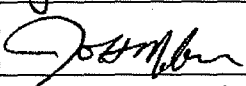

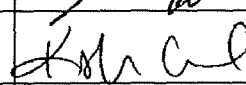

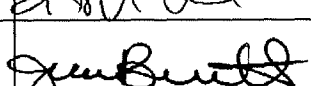

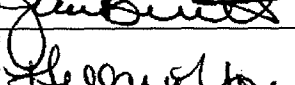

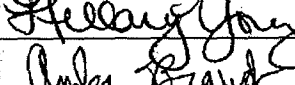

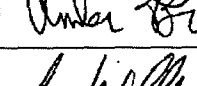

A handwritten signature in black ink, appearing to read "Donald L. Johnson".

SOIL SURVEY

Creek County Oklahoma

UNITED STATES DEPARTMENT OF AGRICULTURE
Soil Conservation Service
In cooperation with the
OKLAHOMA AGRICULTURAL EXPERIMENT STATION

passage to weakly granular structure; friable when moist, very hard and compact when dry; slightly acid.

14 to 24 inches, grayish-brown heavy clay, mottled with yellowish red and yellowish brown; weak blocky structure; very compact and very sticky when moist, extremely hard when dry; very slowly permeable; medium acid.

16 to 12 inches, mottled gray and light olive-brown heavy clay, very sticky and stiff when wet; very slowly permeable; lightly acid in upper part, neutral in lower part.

The thickness of the surface soil ranges from about 10 to 18 inches, and the texture ranges from very fine sandy loam to loam. On a few low sandy mounds the surface soil is fine sandy loam 18 to 30 inches thick. The third layer ranges from dense clay to compact, slowly permeable sandy clay; in places it contains pockets and lenses of sandy loam.

Use and management (Capability unit IIs-1).—This soil is not susceptible to erosion. Fertility is low to moderate. The soil remains wet and cold late in the spring, and when it dries the surface soil crusts and bakes. If the soil is not worked at exactly the right moisture content, large clods form that make it very difficult to maintain a good seedbed.

This soil is not well suited to most common field crops, but it is moderately well suited to native hay or pasture. Most of it is now used for pasture. About one-third of the soil is used for crops, mostly cotton, corn, and sorghums. This soil is in the Claypan prairie range site.

Oil-waste land

Oil-waste land (Oa).—The areas mapped in this miscellaneous land type have been practically ruined for agricultural use by oil and salt-water waste from oil wells. They are more or less gullied and eroded and are almost bare of vegetation. They range in size from about one acre to several acres.

Use and management (Capability unit VIII).—This land is of no value for crops or pasture in its present condition. Some of the less strongly sloping and less severely gullied areas may eventually be revegetated by natural means if no more oil or salt-water waste is dumped on them.

Okemah series

These soils have developed from weakly alkaline shales and clays under a cover of grass in nearly level to gently sloping shallow valleys. They are moderately well drained, dark colored, and slightly acid. They have a dark-colored, crumbly and granular surface soil and upper subsoil. Their lower subsoil is mottled olive-yellow and gray compact clay.

Okemah soils are not mapped separately in Creek County. They are closely associated with soils of the Dennis series in some places and with soils of the Woodson series in others, and are mapped in units with soils of one or the other of these series. The Woodson soils differ from the Okemah soils in being dark gray and having a claypan. The Dennis soils, where they are associated with the Okemah soils, lie in slightly higher positions and have developed from less clayey materials. The Dennis soils are browner than the Okemah soils, and they have more rapid runoff and internal drainage.

A profile of an Okemah soil as mapped with the Woodson soils is described under Okemah and Woodson clay loams, and a profile of an Okemah soil as mapped with

Dennis soils is described under Dennis and Okemah loams, gently sloping.

Okemah and Woodson clay loams (0 to 1 percent slopes) (Ob).—These two soils occur intermixed in small areas or separately in areas of several acres. Woodson clay loam occupies the nearly level, usually lower-lying parts of shallow valleys, and Okemah clay loam the gently sloping, slightly higher surrounding areas, but the two soils are so closely associated that it is not practical to map them separately. They merge with little or no difference in surface appearance. The parent materials of both soils are olive or olive and yellow weakly alkaline clays and shales. The mapping unit occurs mostly in shallow valleys near Kiefer, Mounds, and Edna. Runoff is slow to moderate, and internal drainage is very slow. The native vegetation was tall grasses, mainly big bluestem, little bluestem, side-oats grama, and Indiangrass.

Profile of Okemah clay loam near Mounds in the SW $\frac{1}{4}$ SW $\frac{1}{4}$ sec. 17, T. 16 N., R. 12 E.:

0 to 15 inches, dark-gray clay loam, lower part slightly mottled with brown; granular and friable when moist, very hard when dry; surface crusts in cultivated fields on drying; slightly acid.

15 to 20 inches, dark grayish-brown silty clay loam, slightly mottled with brownish yellow and strong brown; crumbly and friable when moist, sticky and plastic when wet; moderately permeable; slightly acid.

20 to 35 inches, mottled grayish-brown and light olive-brown heavy clay; very sticky and stiff when wet, extremely hard when dry; compact and very slowly permeable; neutral.

35 to 48 inches+, mottled light-gray and olive-yellow clay; very compact; very slowly permeable; weakly alkaline.

The texture of Okemah clay loam ranges from loam to clay loam. The depth to the heavy clay layer ranges from 18 to 25 inches. A few shotlike concretions of iron oxide occur in the two clay layers.

Profile of Woodson clay loam about 1 mile south of Kiefer in the SW $\frac{1}{4}$ SW $\frac{1}{4}$ sec. 28, T. 17 N., R. 12 E.:

0 to 12 inches, dark-gray clay loam; the 6-inch plow layer is slightly lighter in color; crumbly and friable when moist, very hard when dry; surface crusts on drying; slightly acid.

12 to 22 inches, dark-gray heavy clay, faintly mottled with brown; very compact claypan; very sticky and stiff when wet; very slowly permeable; slightly acid to neutral.

22 to 38 inches, dark grayish-brown clay, mottled with yellowish brown; very compact; extremely hard when dry; very slowly permeable; weakly alkaline.

38 to 46 inches+, mottled gray, olive-brown, and yellowish-brown clay or shaly clay; contains a few crystals of gypsum and small shotlike concretions of iron oxide; alkaline but not calcareous.

The thickness of the surface soil ranges from 10 to 14 inches. Considerable mottling occurs in the upper subsoil in the areas that grade toward the Okemah soil.

Some small areas of Parsons silt loam near Kiefer are included in this mapping unit. These areas have a dark grayish-brown silt loam surface soil 12 inches thick, which rests on a mottled grayish-brown, strong-brown, and pale-yellow claypan subsoil. The Parsons soils are not extensive enough in Creek County to be mapped separately and are not described in this report.

Use and management (Capability unit I-4).—The two soils in this mapping unit are the darkest colored and finest textured soils of the prairies. They are the most fertile and productive soils for common field crops that occur in the uplands of this county. Okemah clay loam is slightly more productive than Woodson clay loam. Both soils have a moderately high water-holding capacity

These inclusions consist of 10 to 18 inches of light-brown fine sandy loam over dark grayish-brown silt loam or clay loam, overlain by recent deposits of lighter colored, sandier soil materials.

Use and management (Capability unit IIIw-1).—This soil is moderately productive. It is easily worked and fairly resistant to drought. It is not susceptible to erosion, but some material may be deposited on the surface by flood waters. Cropping is hazardous because most areas are flooded several times a year.

This soil is moderately well suited to crops and, in spite of the flood hazard, about one-fifth of the area is cropped. Cotton, corn, and sorghums are the chief crops. This soil is well suited to pasture, and about one-third is used for this purpose. Nearly half has been left in native forest. The soil is in the Loamy bottom-land range site.

Reinach series

Soils of the Reinach series developed from alkaline to calcareous, reddish, silty to moderately sandy alluvium on low, nearly level stream terraces. They are moderately productive soils and easily worked. They are well suited to all general crops of this area, including alfalfa.

The Reinach soils have a brown to reddish-brown friable surface soil and a silty to moderately sandy subsoil. They are similar to the Yahola soils that occur on the present flood plains, but the Reinach soils lie a little higher and are above ordinary overflow. Their surface soil is darker than the Yahola surface soil, and is alkaline, though usually noncalcareous. Only one Reinach soil is mapped in Creek County.

Reinach very fine sandy loam (0 to 1 percent slopes) (Ra).—This soil occurs on low terraces or benches a few feet higher than the flood plains of the Cimarron River. It developed from reddish, silty to moderately sandy, alkaline, calcareous alluvial sediments. Prairie grasses and scattered elm, hackberry, pecan, and oak trees were the native vegetation. Runoff is slow, and internal drainage is moderate to rapid.

Profile of Reinach very fine sandy loam about 3½ miles north of Drumright on a low terrace of the Cimarron River:

- 0 to 14 inches, reddish-brown very fine sandy loam; the 6-inch plow layer is light reddish brown; weak granular structure; very friable; neutral.
- 14 to 46 inches+, light reddish-brown very fine sandy loam that contains thin strata of reddish-brown and brown silt loam in lower part; friable; very permeable; neutral.

The surface soil ranges from brown to light reddish brown in color and from fine sandy loam to silt loam in texture. Some small areas next to more strongly sloping Teller soils have an overwash of light-brown, slightly acid fine sandy loam, 4 to 10 inches thick.

Use and management (Capability unit I-1).—This soil is well suited to crops and pasture. Most of it is cultivated. Corn, cotton, sorghums, and alfalfa are the principal crops. This soil is easily worked and is not susceptible to erosion. It is in the Loamy bottom-land range site.

Roebuck series

Soils of this series consist of only slightly modified clayey alluvium washed from prairie soils that developed over redbeds. The alluvial deposits are alkaline to weakly calcareous. The native vegetation was forest. Both

runoff and internal drainage are slow to very slow. Most areas are too poorly drained or too frequently flooded to be suitable for cropping unless artificially drained and protected from floods.

The surface soil is reddish brown. The subsoil is reddish clay, slightly mottled with brown and grayish brown. Roebuck clay is the only soil of this series that is mapped in Creek County.

Roebuck clay (0 to 1 percent slopes) (Rb).—This soil occupies parts of the flood plain of the Deep Fork River, where the channel is choked or partly filled by silting. It developed from clayey and silty, alkaline or calcareous, reddish alluvium. A native forest of elm, hackberry, oak, willow, pecan, and cottonwood covers these areas.

This is a poorly drained soil. Both runoff and internal drainage are very slow. The level flood plains are subject to frequent floods. This soil is not susceptible to erosion, but most areas are rapidly being covered with silt.

Profile of Roebuck clay:

- 0 to 20 inches, reddish-brown clay; moderately crumbly when moist, very sticky and plastic when wet; weakly alkaline.
- 20 to 45 inches+, reddish-brown heavy clay, slightly mottled with other shades of brown and some grayish brown; very sticky and stiff when wet, very hard when dry; slowly permeable; weakly calcareous.

Small areas have recent deposits of reddish-brown or brown, alkaline or calcareous, somewhat stratified clay loam and clay, 5 to 15 inches thick. In some places the subsoil below about 30 inches is stratified with brown clay loam and dark-gray calcareous clay.

Use and management (Capability unit Vw-1).—Nearly all of this soil is still in woodland. It is very fertile and would be highly productive if it were drained and protected from flooding, but drainage and flood protection are so difficult as to be almost impossible. Clearing underbrush and culling trees to allow native pecan orchards and bermudagrass pastures to develop may be practical. This soil is in the Heavy bottom-land range site.

Stephenville series*

Soils of this series are of medium depth over the parent materials of soft reddish sandstone or interbedded sandstone and sandy shale. They developed under a scrubby forest of mixed blackjack oak and post oak. Scattered coarse grasses grew in open areas.

These soils are slightly acid. They have a light-colored friable sandy surface layer and a yellowish-red or red friable sandy clay loam subsoil. The subsoil grades into the parent material, usually at a depth of less than 3 feet.

The Stephenville soils occupy nearly level to moderately sloping areas and are closely associated with the very shallow Darnell soils. The two soils are similar in surface appearance, but the Stephenville soils are 20 to 36 inches deep and the Darnell soils are 5 to 20 inches deep over sandstone. Sandstone outcrops are common in both.

In this county, the Stephenville soils are mapped only in units with the Darnell soils. The two series have similar uses and are about equal in productivity.

Stephenville and Darnell fine sandy loams, gently sloping (2 to 4 percent slopes) (Sa).—Stephenville fine sandy loam occupies about 70 percent of this mapping unit. Small areas of Darnell fine sandy loam make up the other 30 percent. This unit is very extensive in the central, southern, and western parts of the county.

These shallow to moderately deep upland soils developed over reddish-yellow to red sandstone or interbedded sandstone and sandy shale. The parent materials were slightly acid to neutral. The native vegetation was a thin to moderately thick forest of scrubby blackjack oak and post oak, and a thin ground cover of bluestem grasses. Both soils are well drained. Runoff is slow to moderate, but internal drainage is moderate to rapid.

Profile of Stephenville fine sandy loam, gently sloping, under a moderately thick cover of scrubby post oak and blackjack oak and bluestem grasses, about 2 miles east of Depew in the SW $\frac{1}{4}$ SW $\frac{1}{4}$ sec. 9, T. 15 N., R. 8 E.:

- 0 to 4 inches, grayish-brown fine sandy loam; in plowed fields this layer is pale brown; weak granular structure; very friable; slightly acid.
- 4 to 12 inches, pale-brown light fine sandy loam; very friable when moist, nearly loose when dry; slightly acid.
- 12 to 28 inches, yellowish-red sandy clay loam; massive structure; crumbly and friable when moist, slightly sticky when wet; porous and permeable; medium acid.
- 28 to 35 inches, yellowish-red sandy clay loam, mottled with red; friable; permeable; contains small soft fragments of partly weathered sandstone; medium to slightly acid.
- 35 inches +, yellowish-red sandstone bedrock; slightly acid to neutral.

The depth to bedrock ranges from about 20 to 40 inches; normally it is less than 30 inches. A few small outcrops of the sandstone bedrock occur.

Profile of Darnell fine sandy loam in a cultivated field of about 2 percent slope, in the NW $\frac{1}{4}$ NW $\frac{1}{4}$ sec. 16, T. 15 N., R. 8 E.:

- 0 to 10 inches, pale-brown light fine sandy loam; structureless; very friable when moist, nearly loose when dry; slightly acid.
- 10 to 16 inches, reddish-yellow fine sandy loam, slightly heavier in lower part; structureless; friable; lower part contains small fragments of partly weathered sandstone; medium acid.
- 16 inches +, reddish-yellow sandstone bedrock; neutral.

The depth of the Darnell soil ranges from about 5 to 20 inches. Most areas are between 8 and 15 inches deep. Small outcrops of sandstone bedrock occur here and there. The transition between the deeper Stephenville soil and the shallower Darnell soil is hardly noticeable; there is no change in slope or in color of the surface soil. Another profile of Darnell soil, as it typically occurs when associated with soils of the Pottsville series, is described under Darnell and Pottsville soils, sloping.

Use and management (Capability unit IIIe-2).—These soils are droughty and low in fertility. They are slightly to moderately susceptible to erosion if cultivated. Most of the cleared acreage has lost up to 20 percent of its surface soil through erosion. Some shallow gullies occur on the more strongly sloping cleared areas.

These soils are moderately well suited to crops and pasture. Yields are moderate under good management. Intensive management is needed to maintain or increase productivity.

About half of this mapping unit is cleared. Most of the cleared acreage has been abandoned for cropping, and it is now used for pasture. Cotton, peanuts, sorghums, corn, cowpeas, and sweetpotatoes are the principal crops. The pastures have a thin cover of three-awn grasses, bluestem grasses, and weeds. This unit is in the Sandy savanna range site. Nearly half of it is native woodland.

Stephenville and Darnell fine sandy loams, sloping (4 to 7 percent slopes) (Sb).—These soils are like Stephenville

and Darnell fine sandy loams, gently sloping, except that the surface soil is somewhat thinner, the bedrock is nearer the surface, and outcrops of sandstone are more common. About 60 percent of the acreage consists of Stephenville soils and about 40 percent of Darnell soils.

Use and management (Capability unit VIe-1).—This land is not well suited to crops. It is droughty, low in natural productivity, and highly erodible if cultivated. Moderate yields of common field crops are produced when the soils are first cultivated, but yields decline rapidly.

More than half of this mapping unit is still in woodland. The remainder has been cleared, but little is still used for crops. Cotton, corn, sorghums, peanuts, and cowpeas are grown. Yields are about three-fourths as much as on the gently sloping soils. Most of the acreage that was cleared, cultivated, and abandoned is now in pasture. The vegetation is three-awn grass and weeds. This unit is in the Sandy savanna range site.

If these soils are cultivated, very careful management is needed. They should be terraced, stripcropped, and contour-cultivated, and erosion-resistant crops should be planted. Areas where the soils are too shallow to be terraced should be used for pasture.

Stephenville and Darnell fine sandy loams, sloping, severely eroded (4 to 7 percent slopes) (Sc).—The soils in this mapping unit have been so severely eroded that they are worthless for crops. Originally, they were like Stephenville and Darnell fine sandy loams, sloping, but erosion has removed much of the surface soil. Numerous gullies are now active; some cannot be crossed with tillage implements.

Use and management (Capability unit VIIe-2).—These soils were never well suited to crops, and now they are of no value for crops. All of the acreage has been cultivated, but most of it is now idle or in pasture. A thin stand of annual grasses and weeds furnishes poor grazing. It would take careful management to establish even moderately good pastures. Cotton, corn, sorghums, cowpeas, and peanuts are still grown on a few acres, but yields are low. This mapping unit is in the Eroded savanna range site.

Stidham series

The Stidham soils developed from acid sandy old alluvium on stream terraces under a mixed hardwood forest. They are low in natural fertility, but they are very responsive to management. They are well suited to fruits, special crops, and field crops.

Soils of this series have a light brownish-gray to pale-brown, friable, acid surface soil. The subsoil is yellowish-brown friable sandy clay loam, mottled with light gray and strong brown in the lower part.

Stidham soils are closely associated with Dougherty soils, which have a reddish subsoil, and with Eufaula soils, which have no loamy subsoil within 4 feet of the surface. In Creek County, the Stidham soils are not mapped separately. They are mapped in units with soils of the Dougherty series. A profile of a Stidham soil is described under Dougherty and Stidham fine sandy loams, nearly level.

Talihina series

The Talihina soils developed from beds of slightly acid to neutral, gray, brown, and olive shale that included a little sandstone. They are very shallow, slightly acid

grasses and scattered elm, hackberry, and mesquite trees grew on these soils. Runoff is slow, and internal drainage is moderate. This soil is closely associated with Teller silt loam, nearly level, but it has a darker colored surface soil and a brown or yellowish-brown, instead of a red, subsoil.

Profile of Vanoss silt loam, nearly level, in a cultivated field about 3 miles east of Oilton in the NE $\frac{1}{4}$ sec. 34, T. 19 N., R. 7 E.:

- 0 to 16 inches, dark grayish-brown silt loam; the 6-inch plow layer is slightly lighter in color; moderate granular structure; friable when moist, hard when dry; neutral.
- 16 to 28 inches, dark-brown clay loam; medium granular structure; crumbly and friable when moist, hard when dry; permeable; neutral.
- 28 to 38 inches, brown clay loam, faintly mottled with strong brown; crumbly and friable; permeable; neutral.
- 38 to 48 inches +, yellowish-brown clay loam; slightly more friable and noticeably more sandy than layer above; neutral to weakly alkaline.

The surface soil ranges in color from very dark grayish brown in undisturbed areas to grayish brown in cultivated fields, and in texture from very fine sandy loam to heavy silt loam. In areas where this soil grades toward the Teller soils, the upper subsoil is brown and the lower subsoil is strong brown to reddish brown.

A few small level areas of Brewer silt loam are included in this mapping unit. These areas have a dark-gray silt loam surface soil 14 inches thick over a dark-gray crumbly clay subsoil. Brewer soils are not mapped separately in Creek County, and they are not described in this report.

Use and management (Capability unit I-3).—This is a moderately productive, easily worked soil. It responds well to good management, and it is not susceptible to erosion.

This soil is excellent for crops and well suited to pasture. About three-fourths of it is cultivated. The principal crops are cotton, corn, sorghums, and oats. The rest is used for pasture. This soil is in the Loamy prairie range site.

Vanoss silt loam, gently sloping (2 to 4 percent slopes) (Va).—This soil is similar to Vanoss silt loam, nearly level, but its slope makes it slightly susceptible to erosion if cultivated. It occurs in small areas in association with nearly level Vanoss and Teller soils.

Use and management (Capability unit IIe-1).—More than half of this soil is used for crops. The same crops are grown as on Vanoss silt loam, nearly level, but yields are slightly lower. Eroded areas are 10 to 20 percent less productive than the normal soil. Good management would restore the original productivity in 2 or 3 years. This soil is in the Loamy prairie range site.

Verdigris series

These soils occupy the flood plains of streams. The alluvium from which they developed came mostly from dark soils of the prairies; some came from light-colored soils. Soils of this series are moderately well drained, but they are flooded occasionally to frequently. The periodic floods do not prevent successful cultivation except in the narrow flood plains of small streams.

These soils have a dark grayish-brown, friable, slightly acid surface soil and a dark grayish-brown clay loam subsoil. The subsoil is slightly mottled and somewhat finer textured in the lower part. Verdigris soils are

darker colored than the Pulaski soils and have more retentive, less sandy subsoils. They are similar to the Mason soils, which lie slightly higher and are above ordinary overflow.

Verdigris fine sandy loam (0 to 1 percent slopes) (Vd).—This soil occupies parts of narrow flood plains, mainly in the central and western parts of the county. The parent materials were slightly acid to weakly alkaline alluvial sediments, most of which were washed from dark soils of the prairie; some were derived from light-colored soils of forested areas. Runoff is slow, and internal drainage is moderate. These soils are flooded for short periods several times a year. Fresh alluvial sediments are deposited on most areas during floods. Native forests of elm, hackberry, oak, pecan, and cottonwood grew on these soils, and some coarse grasses and shrubs covered the ground.

Profile of Verdigris fine sandy loam:

- 0 to 14 inches, grayish-brown fine sandy loam, weakly stratified in lower part with dark grayish-brown silt loam; very friable when moist; slightly acid.
- 14 to 32 inches, dark grayish-brown clay loam; crumbly and friable when moist, moderately sticky when wet; slightly acid to neutral.
- 32 to 50 inches +, dark grayish-brown clay loam, mottled or splotted with light brown; contains thin seams or lenses of light-brown fine sandy loam below about 40 inches; neutral.

Most areas of this soil are covered by recent alluvium, 5 to 15 inches thick. This alluvium ranges from brown to dark grayish brown in color. The texture is fine sandy loam. It is somewhat stratified below plow depth. The clay loam subsoil is dark gray or dark grayish brown in most places.

Use and management (Capability unit I-2).—This is a moderately productive soil. It is likely to be flooded late in spring; consequently, cropping is uncertain. This soil does not erode, but a considerable amount of soil material is deposited by floodwater. Areas where floods are least frequent are well suited to crops. Corn, cotton, and sorghums are the most common crops. The soil is also well suited to pasture. Two-thirds of the acreage has been cleared for crops and pasture, and one-third is still under native forest. This soil is in the Loamy bottom-land range site.

Verdigris silt loam (0 to 1 percent slopes) (Ve).—This soil is mapped on flood plains of streams throughout the county. The parent material consisted of slightly acid to weakly alkaline alluvial sediments washed from dark soils of the prairies. The native vegetation was a hardwood forest of elm, oak, hackberry, cottonwood, and pecan trees, and scattered coarse grasses. Runoff is slow, and internal drainage is moderate. This soil is flooded one to three times a year; nevertheless, most of it can be successfully cropped.

Profile of Verdigris silt loam in a cultivated field about 4 miles west of Bristow in the SW $\frac{1}{4}$ SW $\frac{1}{4}$ sec. 34, T. 16 N., R. 8 E.:

- 0 to 16 inches, dark grayish-brown silt loam; friable and easily worked when moist, hard when dry; slightly acid.
- 16 to 36 inches, dark grayish-brown clay loam, faintly mottled with brown in the lower part; crumbly and friable when moist, hard when dry; porous and permeable; slightly acid to neutral.
- 36 to 46 inches +, dark grayish-brown clay loam, splotted or mottled with brown and gray; friable; permeable; weakly alkaline.

The surface layer is 10 to 20 inches thick. In some places the lower part of this layer is weakly stratified with fine sandy loam and clay loam. The subsoil is slightly acid to weakly alkaline. Stratified darker colored and lighter colored sediments may occur in the lowest layer.

Use and management (Capability unit I-2).—This soil is well suited to crops or pasture. It is somewhat more productive than Verdigris fine sandy loam. It is not susceptible to erosion, but soil material may be deposited on the surface by floods. The flood-deposited material replenishes the supply of plant nutrients. About one-fourth of this soil is still under native forest. Half of the remainder is cropped, mostly to corn, cotton, sorghums, and alfalfa. Yields range from almost complete failures to very high yields. Some of the soil is in pasture. This soil is in the Loamy bottom-land range site.

Verdigris clay loam (0 to 1 percent slopes) (Vc).—This soil occurs on the wider flood plains of the larger creeks of the county. The alluvial sediments from which it developed are slightly acid to weakly alkaline. They were washed from dark-colored soils of the prairies. Runoff is slow, and internal drainage is moderate. The native vegetation was a forest of elm, hackberry, ash, oak, pecan, and cottonwood, and coarse grasses.

Profile of Verdigris clay loam about $\frac{1}{2}$ mile southeast of Sapulpa in the NW $\frac{1}{4}$ SW $\frac{1}{4}$ sec. 6, T. 17 N., R. 12 E.:

- 0 to 20 inches, dark grayish-brown clay loam; moderately granular structure; crumbly and friable when moist, hard when dry; porous; slightly acid.
- 20 to 38 inches, grayish-brown clay loam, slightly mottled with brown and some pale brown; friable; permeable; slightly acid.
- 38 to 46 inches +, grayish-brown clay loam, mottled with other shades of brown; contains pockets and thin seams of brown fine sandy loam; slightly acid.

The color of the surface layer ranges from very dark brown in undisturbed areas to dark grayish brown or dark brown where cultivated. Small areas have a 3- to 5-inch layer of grayish-brown loam that has been deposited on the surface by floodwaters.

Use and management (Capability unit I-2).—This is a highly productive soil. Most of the areas are flooded one to three times a year, but this does not prevent their use for cultivated crops. This soil is not susceptible to erosion, but on most areas soil material is deposited during floods.

About one-third of this soil is cultivated. Corn, cotton, and sorghums are the principal crops. About one-fourth is in woodland. The rest is idle or used for pasture. This soil is in the Loamy bottom-land range site.

Woodson series

These are claypan soils that developed from alkaline or weakly calcareous shales and clays on nearly level to gently sloping prairies. They occupy small nearly level areas in gently sloping shallow valleys. These soils are dark grayish brown to dark gray. They are slightly acid.

Woodson soils are closely associated with soils of the Okemah series. The two series differ little in surface appearance. The Woodson soils have a thinner and more granular surface soil than the Okemah soils, and they have a dark-gray claypan subsoil. Woodson soils are not mapped separately in this county. Areas of Woodson clay loam are included in Okemah and Woodson clay loams, and a profile of the Woodson soil is described under that unit.

Yahola series

These soils occur on the flood plains of the Deep Fork and Cimarron Rivers and other large streams. The parent material was alluvium derived from grassland soils underlain by redbeds. Soils of the Yahola series have a reddish-brown alkaline or calcareous surface soil and a moderately sandy subsoil.

These soils are moderately to highly productive. Areas that are not flooded too often are well suited to general field crops. Yahola soils are similar to Port soils in surface appearance, but they have a sandier subsoil. They are more alkaline than Pulaski soils. Yahola soils have a sandier subsoil and more rapid internal drainage than the Roebuck soils.

Yahola very fine sandy loam (0 to 1 percent slopes) (Yb).—This soil occurs on the flood plains of the Cimarron and Deep Fork Rivers. It developed from calcareous or alkaline sandy alluvial sediments washed from prairies underlain by redbeds. Runoff is slow to moderate, and internal drainage is moderate to rapid. All areas of this soil are periodically flooded. Those on the flood plain of the Deep Fork River are too frequently flooded to be suitable for crops, and they have been left in native hardwood forest. The native vegetation was a forest of elm, ash, oak, cottonwood, and pecan trees. Coarse grasses grew where the forest was thin.

Profile of Yahola very fine sandy loam about $\frac{1}{2}$ mile north of Oilton in the NW $\frac{1}{4}$ SW $\frac{1}{4}$ sec. 28, T. 19 N., R. 7 E.

- 0 to 16 inches, reddish-brown very fine sandy loam; structure less; very friable; alkaline but not calcareous.
- 16 to 46 inches +, reddish-yellow light fine sandy loam, weakly stratified in the lower part with loamy fine sand; very friable and freely permeable; alkaline but not calcareous.

The surface soil is alkaline or calcareous. In color it ranges from light brown to reddish brown and in texture from fine sandy loam to silt loam. Small areas where floodwaters have recently deposited sediments may be weakly stratified.

Use and management (Capability unit I-2).—This soil is easily worked and moderately productive. Areas that are not flooded too often are well suited to crops. The soil is not susceptible to erosion. It receives fresh deposits of soil material during floods.

All of the cropland is on the flood plain of the Cimarron River. Cotton, corn, and sorghums are the principal crops. This soil is in the Loamy bottom-land range site.

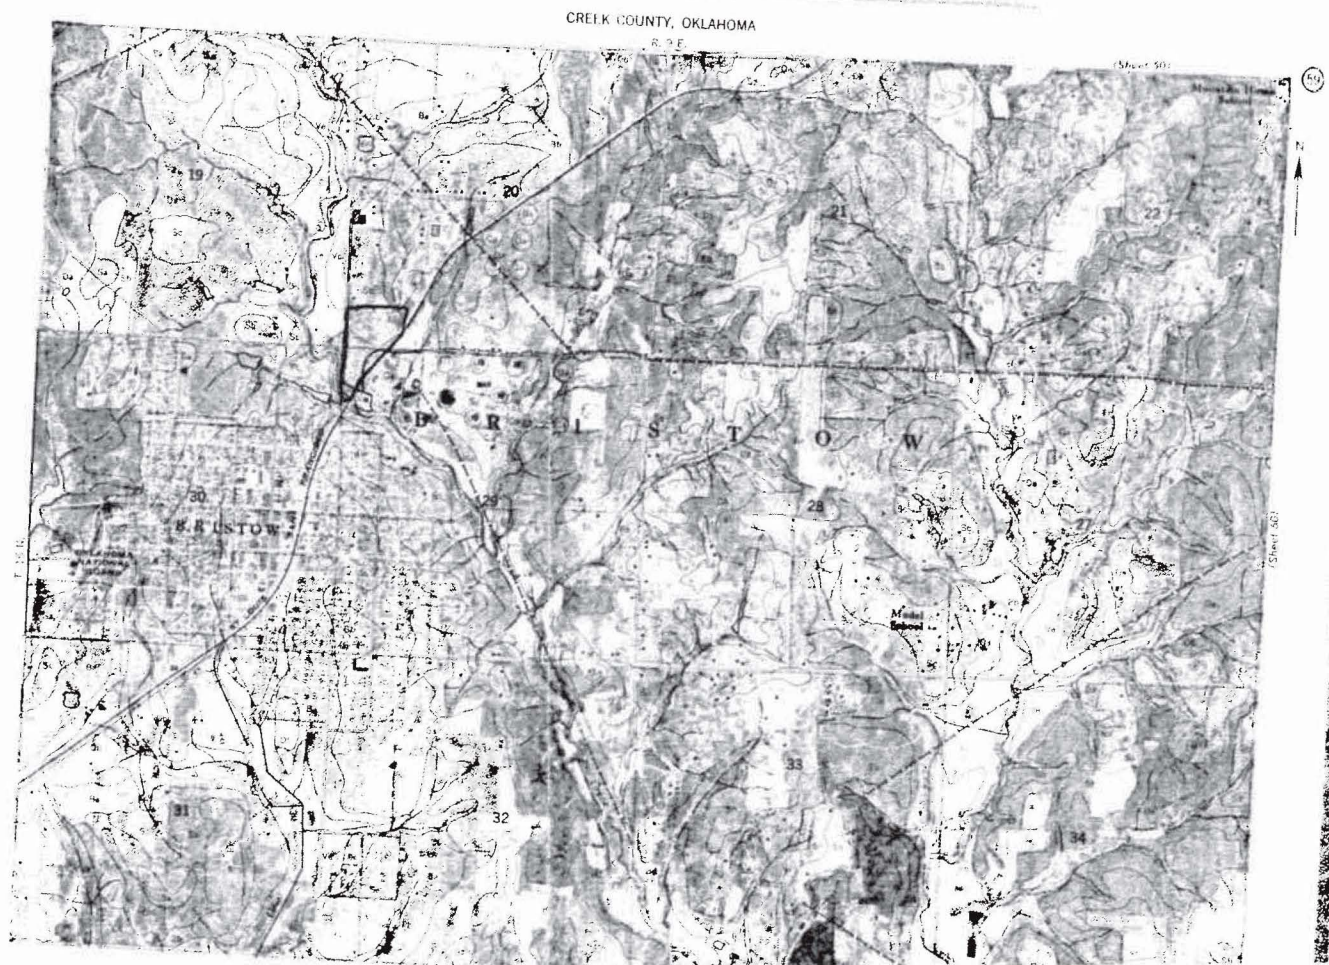

Yahola clay loam (0 to 1 percent slopes) (Ya).—This soil developed from reddish, calcareous, sandy alluvium on the flood plains of the Deep Fork and Cimarron Rivers. The native vegetation was a forest of elm, hackberry, oak, pecan, cottonwood, and ash. Coarse grasses grew where the forest was thin. Runoff is slow but internal drainage is rapid through the sandy substratum.

This soil is associated with Yahola very fine sandy loam. It is like that soil except for having a finer textured surface soil.

Profile of Yahola clay loam:

- 0 to 14 inches, reddish-brown clay loam; crumbly and friable when moist, moderately sticky when wet; alkaline and weakly calcareous.
- 14 to 45 inches +, reddish-yellow very fine sandy loam, weakly stratified in lower part with loamy sands and clay loam; very permeable; weakly calcareous.

Summary

Labs performing analysis on this Sample:

Metals GCMS

SOURCE: LORRAINE REFINERY

SAMPLERS COMMENTS:

LWGW-10

ANALYST'S COMMENTS:

Analyst: Cassandra Kontas

The analysis indicates the presence of one or more compounds that have been 'tentatively identified,' and the associated numerical values represent their approximate concentration.

Summary

Labs performing analysis on this Sample:

Metals GCMS

SOURCE: LORRAINE REFINERY

SAMPLERS COMMENTS:

LWW-3

ANALYST'S COMMENTS:

Analyst: Cassandra Kontas

The analysis indicates the presence of one or more compounds that have been 'tentatively identified,' and the associated numerical values represent their approximate concentration.

The name of the tentatively identified compound was truncated in the report table; the complete name is:

Octadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester

ANALYST'S COMMENTS:

Analyst: Cassandra Kontas

The analysis indicates the presence of one or more compounds that have been 'tentatively identified,' and the associated numerical values represent their approximate concentration.

The names of the tentatively identified compounds were truncated in the report table; the complete names are:

Pentadecane, 2,6,10,14-tetramethyl-

Hexadecane, 2,6,10,14-tetramethyl-

Hexadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester

Octadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester

SAMPLERS COMMENTS:

LWSS-9

ANALYST'S COMMENTS:

Analyst: Cassandra Kontas

The analysis indicates the presence of one or more compounds that have been 'tentatively identified,' and the associated numerical values represent their approximate concentration.

The names of the tentatively identified compounds were truncated in the report table; the complete names are:

Hexadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester

Octadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester

Summary

Labs performing analysis on this Sample:

Metals GCMS

SOURCE: LORRAINE REFINERY

SAMPLERS COMMENTS:

LWSS-4

ANALYST'S COMMENTS:

Analyst: Cassandra Kontas

The analysis indicates the presence of one or more compounds that have been 'tentatively identified,' and the associated numerical values represent their approximate concentration.

The name of the tentatively identified compound was truncated in the report table; the complete name is:

Octadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester

COMPOUND	TENTATIVELY IDENTIFIED BY NBS LIBRARY SEARCH	VALUE	UNITS
Hexadecanoic acid, 2-hydroxy-1-		460	µg/kg
Octadecanoic acid, 2-hydroxy-1-		940	µg/kg

Summary

Labs performing analysis on this Sample:

Metals GCMS

SOURCE: LORRAINE REFINERY

SAMPLERS COMMENTS:

LWSS-8

ANALYST'S COMMENTS:

Analyst: Cassandra Kontas

The analysis indicates the presence of one or more compounds that have been 'tentatively identified,' and the associated numerical values represent their approximate concentration.

The names of the tentatively identified compounds were truncated in the report table; the complete names are:

Hexadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester

Octadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester

Records of Communication

August 3, 2009

Todd Downham
Lorraine Refinery Expanded Site Inspection (ESI)

August 3, 2009: Spoke with Steve McGuire, Public Works Director, City of Bristow, Ok. Mr. McGuire answered my questions regarding the locations of Municipal Wells that provide drinking water to the City of Bristow. He provided a map with the names and locations of each well.

April 6, 2010

Todd Downham
Lorraine Refinery Expanded Site Inspection (ESI)

April 6, 2010: Spoke with Steve McGuire, Public Works Director, City of Bristow, Ok. Mr. McGuire answered my questions regarding the locations of Municipal Wells that provide drinking water to the City of Bristow.

The Site boundary for the planned ESI for the Lorraine Refinery has expanded to include the former Wilcox Refinery Site, therefore updated information regarding public groundwater drinking wells is required. The map provided by the City of Bristow on August 3, 2009, which indicates the location of Municipal Drinking Water Wells, is current and will be used to determine the locations and rational outlined in the Sampling and Analysis Plan (SAP) and in the Lorraine Refinery ESI Final Report.

Bristow Water Distribution System Information

Number of Water Wells: 5 Active Wells

Age of Wells & Distribution System:

Well # 18	40 Years
Well # 20	30 Years
Well # 23	15 Years
Well # 24	15 Years
Well # 25	15 Years

Capacity of Wells

Depths

Well # 18	210'
Well # 20	470'
Well # 23	450'
Well # 24	450'
Well # 25	450'

Average Volume Actually Pumped:

Well # 18	129,000 gallon per-day
Well # 20	220,000 gallons Per-day
Well # 23	280,000 gallons per-day
Well # 24	140,000 gallons per-day
Well # 25	220,000 gallons per-day

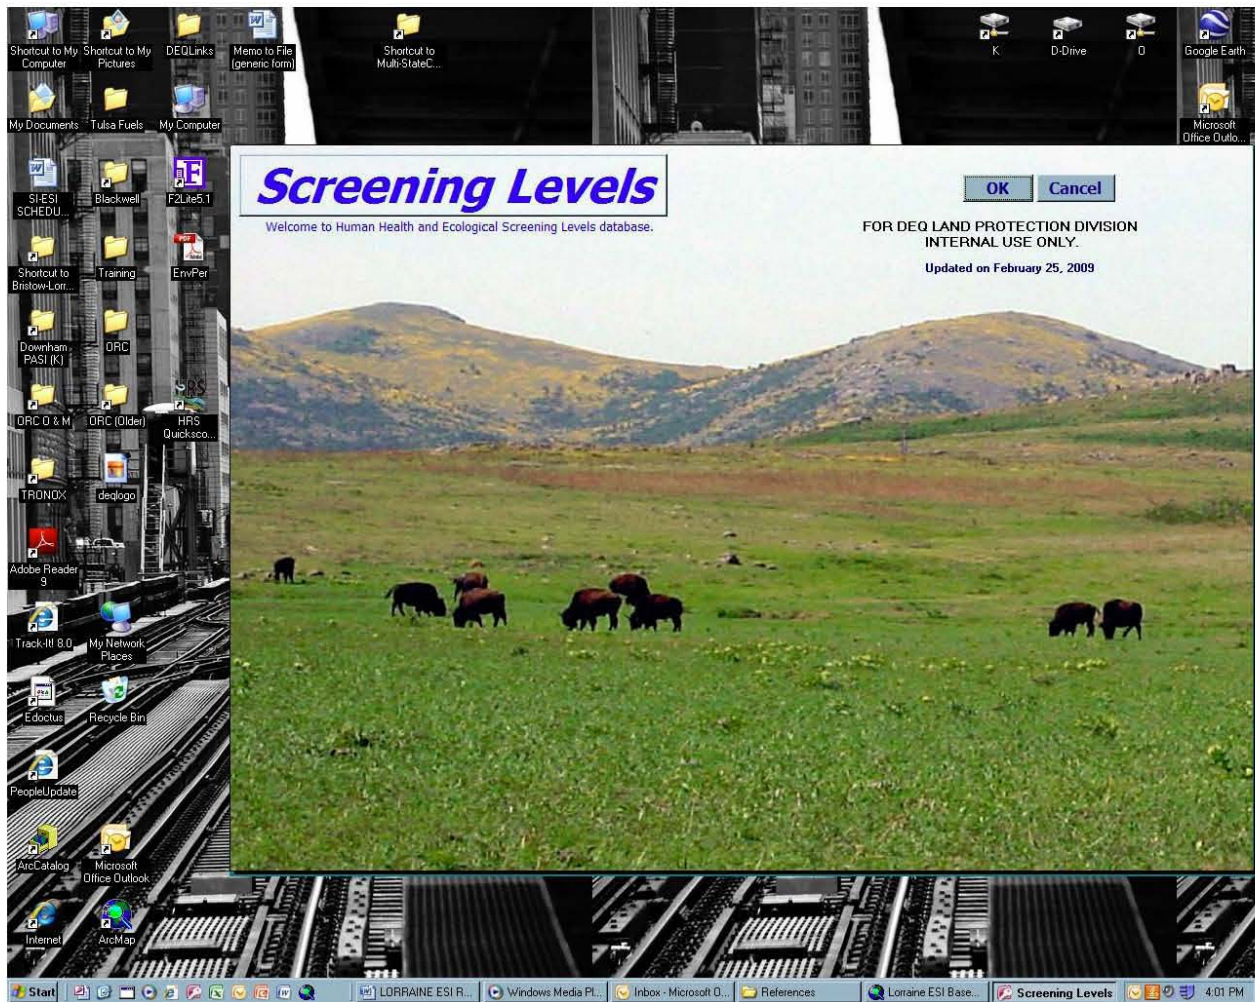

Leakage Estimate: Approximately 6,449,112 gallons per year

Number of Connection in Bristow:

	<u># of customers</u>	<u>Average consumption in 1000 gallons per month</u>
Domestic:	1529	6,764,000
Business	274	4,612,000
Agriculture	0	0
Un-metered	4	45000
Water Sold to Slick	1	850,000
